Topics may include force and displacement methods and fluid mechanics.

PREREQUISITE(S): none

COURSE LEARNING OUTCOMES / OBJECTIVES

Upon successful completion of this course a student will be able to:

- Demonstrate the fundamental principles of engineering structural analysis by:
 - Preparing shear and bending moment diagrams and deflected shape of beams and frames under load,
 - Using slope deflection and moment distribution method to analyze statically indeterminate beams and frames,
 - Using matrix methods to analyze statically indeterminate 2D trusses, and

- Determining the principal moments of inertia for common structural shapes
- Demonstrate the fundamental principles of engineering fluid mechanics by:
 - Calculating forces on partially of fully submerged plane and curved areas,
 - Applying Archimedes' Principle to analyze buoyancy and stability conditions with respect to floating and submerged bodies,
 - Predicting friction and minor losses for laminar and turbulent flow,
 - Selecting pumps for piping systems, and
 - Determining flow rates and pressure losses in piping systems.
