CALENDAR DESCRIPTION

Students will study the principles of solid mechanics focusing on calculus-based applications. They will cover: internal loads, stresses and strains due to axial, shear, bending and torsion loads, statically indeterminate structures, elasto-plastic behavior, deflection of beams, Mohr's circle for stress and strain, and design of pressure vessels and column buckling.

PREREQUISITE(S): C in ENGR 262

COURSE LEARNING OUTCOMES / OBJECTIVES

Upon successful completion of this course a student will be able to:

- Determine the stresses, strains and displacements in structures and their components due to axial, shear, torsion and bending loads, both individually and in combinations;
- Determine the deflections of determinate and indeterminate beams and frames under load;
- Determine maximum in-plane and tri-axial stresses and maximum in-plane strains;
- Design spherical and cylindrical pressure vessels;
- Predict the failure mechanism for an element of a structure under load; and

- Establish the safe load for a column under various loading and support conditions.
