CALENDAR DESCRIPTION

Restricted to students in Mechanical Engineering Technology

Students will examine material properties for a wide variety of ferrous and nonferrous engineering materials along with property modification using alloying, surface treatment and heat treatment. Use of phase diagrams, time-temperature transformation (TTT) diagrams, and microstructure analysis will also be covered. Various polymeric materials, adhesives, ceramics, glasses, and corrosion protection using coatings and plating will be examined. Through a series of case studies, students will learn about the selection and application of appropriate engineering materials.

COURSE LEARNING OUTCOMES / OBJECTIVES

Upon successful completion of this course a student will be able to:

- Compare the mechanical properties of a wide variety of common engineering materials such as: ferrous and non-ferrous alloys (metals), ceramics, polymeric materials (plastics), composites
- Describe various types of heat treatments, and predict the mechanical behavior of several alloys using TTT diagrams.
- Evaluate material properties by performing tensile, hardness, and impact tests on heat treated and non-heat-treated metal samples.
- Describe the mechanical properties of common types of ceramic materials and composite structures.
- Select engineering materials that are appropriate for various simple design applications.
- Design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, ethical, health and safety, manufacturability, and sustainability – the design process
- Have the ability to apply knowledge of Engineering Materials to solve problems related to materials selection and optimization
- Integrate understanding of the scientific and engineering principles underlying the four major elements: structure, properties, processing, and performance related to material systems appropriate to the field
